1. There are many habits I've gained while working from home: snacking when desired, taking the dog for a midmorning walk, talking to myself and settling in for a daily nap. That last one will be especially painful to give up if or when I return to an office; my naps have become essential downtime that act as afternoon pick-me-ups. Why do my naps feel so needed and so revitalising? And will I have to live without?

There are two biological processes that contribute to daily drowsiness, says Sara Mednick, a professor of cognitive science at the University of California at Irvine and author of *Take a Nap! Change Your Life*.

The first system is the circadian: It prompts you to stay awake when it's light out and asleep when it's dark. In the middle of the day, it causes the hormone cortisol to start decreasing from its morning high and your core body temperature to slightly dip; losing heat helps you fall and stay asleep. The second is the homeostatic: It makes you sleepier the longer you've been awake. As the day progresses, it continually increases your "sleep pressure," causing you to have a growing need for sleep. Together, at midday, these create "kind of a perfect storm that makes people tired," Mednick says.

For many people who are sleep-deprived, a short shut-eye session is the ticket, Mednick says. "Your mood gets better, your creativity, your perceptual processing, your memory processing."

Mednick has found that nappers perform as well on a pattern-recognition task as people who have slept overnight. She has found that naps enhance creative problem-solving. Naps can boost and restore brain power. Toddlers who nap express more joy. Adults nappers can tolerate frustration longer and feel less impulsive. Naps may help protect older

people from cognitive decline and dementia. Runners can use naps to improve endurance. People who nap once or twice a week have a lower risk of cardiovascular disease. Memory is better after a nap. And it goes.

Source: washingtonpost.com

What can we conclude from the effects of taking a nap discussed in paragraph 5?

- A. The effects of napping include both psychological and physiological advantages.
 - B. If done correctly, napping can have a huge range of health benefits.
 - C. Taking a nap does not only help with metabolism, but also with mood regulation.
 - D. Children are more affected by naps than adults are.
 - E. The advantages of napping for the human brain are its most significant effects.
2. There are many habits I've gained while working from home: snacking when desired, taking the dog for a midmorning walk, talking to myself and settling in for a daily nap. Which question is answered by paragraph 5?

- A. Why do many people take naps?
 - B. What are the benefits of naps?
 - C. What are the drawbacks of taking naps?
 - D. What makes naps better than sleeping overnight?
 - E. Why does our body need naps?
5. A complete skeleton of a 19- or 20-year-old Homo sapiens was found during 2020 excavations at a site called Liang Tebo, in remote Sangkulirang-Mangkalihat region of eastern Kalimantan. Early human remains are scarce in the region, and the researchers involved in this study suggest this may be the oldest known burial of a modern human that has ever been found in the region's islands. During the dig, the find took on a whole new level of intrigue as

TO UTBK #5 Zenius

Literasi Bahasa Inggris

the team discovered that the skeleton's lower leg was entirely missing. The limb had been not broken or smashed, but cleanly removed, and the archaeologists found unusual bony overgrowth on the remaining fragments of the tibia and fibula. That overgrowth matched overgrowth seen in modern clinical cases of amputations.

Further investigations showed that the bone developed atrophy, indicating the part of the limb that remained was a stump with limited use. Investigations into this remodeling of bone structure showed some six to nine years of such changes. "This confirms that the surgery was not fatal, not infected and likely occurred during late childhood," says Tim Maloney, who specializes in the archaeology of Borneo at Griffith University, in Australia, and co-authored the study.

To perform a successful operation, prehistoric surgeons must have had knowledge of anatomy. They sliced through not only bone but muscles, veins and nerves in such a way that the patient didn't bleed to death or go into a fatal state of shock. Their scalpels were likely the flaked lithic edges common to the era: a stone called chert, which can produce extremely sharp edges. Afterwards the surgeons may have employed a tourniquet or cauterizing, though neither would leave clear evidence on the skeleton and so remain unknown possibilities.

What seems certain, however, is that the patient enjoyed a considerable level of post-op care. "It is highly unlikely that this individual could have survived the procedure without intensive nursing care, including blood loss and shock management, and regular wound cleaning," Maloney notes. He believes the successful operation implies that the community also had some understanding of antiseptic and antimicrobial

management to prevent fatal infection. In this, their foraging lifestyle and forest environment might have proved to be advantages.

Source: smithsonianmag.com (with modifications)

Which information indicates the assertion that the early human survived the suggested amputation?

- A. The skeleton does not include a lower leg part.
- B. The bone of the amputated leg shrunk in size.
- C. The amputated part was cleanly removed.
- D. The remaining part of the leg shows no signs of infection.
- E. There could have been a post-op care.

What is the significance of the expression “the find took on a whole new level of intrigue”?

- A. To emphasize the importance of the information that follows
- B. To provide an example for the findings of the early human remains in Liang Tebo

- C. To elaborate the finding of the oldest modern human burial site
- D. To introduce the information about the finding of an advanced surgery method
- E. To introduce the comparison between early and modern methods of amputation

7. The researchers set up a mock prison in the basement of Stanford University's psychology building and then selected 24 undergraduate students--with no criminal background, lacked psychological issues, and had no significant medical conditions--to play the roles of both prisoners and guards. The volunteers agreed to participate during a one to two-week period in exchange for \$15 a day.

The simulated prison included three six by nine-foot prison cells. Each cell held three prisoners and included three cots. Other rooms across from the cells were utilized for the jail guards and warden. One tiny space was designated as the solitary confinement room, and yet another small room served as the prison yard.

The 24 volunteers were then randomly assigned to either the prisoner group or the guard group. Prisoners were to remain in the mock prison 24-hours a day during the study. Guards were assigned to work in three-man teams for eight-hour shifts. After each shift, guards were allowed to return to their homes until their next shift. Researchers were able to observe the behavior of the prisoners and guards using hidden cameras and microphones.

While the Stanford Prison Experiment was originally slated to last 14 days, it had to be stopped after just six due to what was happening to the student participants. The guards became abusive, and the prisoners began to show signs of extreme stress and anxiety. While the prisoners and guards were allowed to

TO UTBK #5 Zenius

Literasi Bahasa Inggris

interact in any way they wanted, the interactions were hostile or even dehumanizing. Five of the prisoners began to experience severe negative emotions, including crying and acute anxiety and had to be released from the study early.

According to Zimbardo and his colleagues, because the guards were given total freedom, they began to behave in ways they would not usually act in their everyday lives or other situations. The prisoners, placed in a situation where they had no real control, became passive and depressed.

Source: verywellmind.com (with modifications)

What can be inferred from the passage?

- A. Putting people in isolated cells damages their brain.
 - B. Possession of power and control alters human behavior.
 - C. People enjoy pleasure from others' stress and anxiety.
 - D. The researchers had planned the outcome of the experiment.
 - E. Money incentives don't help people to endure torture.
8. The researchers set up a mock prison in the basement of Stanford University's psychology building and then selected 24 undergraduate students--with no criminal background, lacked psychological issues, and had no significant medical conditions--to play the roles of both prisoners and guards. The volunteers agreed to participate during a one to two-week period in exchange for \$15 a day.

Source: verywellmind.com (with modifications)

The sentence "... the interactions were hostile or even dehumanizing" implies

- A. the isolated condition of prisoners was dangerous for their mental health
- B. the prisoners rebelled and started attacking the guards

- C. the guards became aggressive and abusive toward the prisoners
- D. both the guards and the prisoners felt depressed and anxious
- E. the guards started to sympathize more with the prisoners

11. The researchers set up a mock prison in the basement of Stanford University's psychology building and then selected 24 undergraduate students--with no criminal background, lacked psychological issues, and had no significant medical conditions--to play the roles of both prisoners and guards. The volunteers agreed to participate during a one to two-week period in exchange for \$15 a day.

Literasi Bahasa Inggris

“beans”, and coffee still remains an important element of their traditional cuisine. Exactly how and when it spread beyond Ethiopia is still the subject of many legends, but the available historic records suggest that the Sufis of Yemen were the first truly devoted drinkers outside Africa in the Middle Ages. Its caffeine helped them to continue their practices late into the night, while the roasting of the bean was apparently taken as an analogy for the transcendence of the human soul.

Coffee houses soon spread across the Middle East and the Ottoman Empire, where they caught the attention of Western traders, who took the beguiling drink back to their home countries in the 17th Century. (...). One newspaper advert in 1657 described the drink as “having many excellent virtues, closes the orifice of the stomach, fortifies the heart within, helps digestion, brights up the spirit.”

Some studies suggest that coffee can offer some protection from certain common diseases. A recent review of the evidence by Susanna Larsson at the Karolinska Institute in Sweden found that each cup of coffee per day is associated with a 6% reduction in the risk of type 2 diabetes. Laura Van Dongen at Wageningen University, meanwhile, has found that regular coffee drinkers were at least 20% less likely to die from heart disease.

source: bbc.com

People often mistakenly classify coffee as a type of plant to which peanuts, chickpeas or lentils belong. Is this statement supported by the passage? Which information can prove it?

- A. Supported, the passage mentions that coffee is grown in Ethiopia, a place where the other plants are mentioned to not grow in.
- B. Supported, the passage states that coffee is not a legume, unlike the other

plants which fit the definition of the word.

- C. Not supported, the passage mentions how coffee was spread to the westerners through the Middle East, same as the other plants.
- D. Not supported, coffee was stated to be able to reduce someone’s risk of dying from heart problems, much like the other plants.
- E. Supported, it is mentioned that coffee is beguiling, whis is a quality the other plants are not exactly known for.

(...). One newspaper advert in 1657 described the drink as “having many excellent virtues, closes the orifice of the stomach, fortifies the heart within, helps digestion, brights up the spirit.”

Some studies suggest that coffee can offer some protection from certain common diseases. A recent review of the evidence by Susanna Larsson at the Karolinska Institute in Sweden found that each cup of coffee per day is associated with a 6% reduction in the risk of type 2 diabetes. Laura Van Dongen at Wageningen University, meanwhile, has found that regular coffee drinkers were at least 20% less likely to die from heart disease.

Which of the following statements is incorrect about coffee based on the text?

- A. China is gradually becoming an emergin market for coffee.
 - B. Coffee became more popular in the western world thanks to the Yemeni Sufis that drank coffee outside Africa.
 - C. How coffee first got produced and consumed outside Ethiopia is still a question yet to be answered.
 - D. Coffee can prevent us from getting some dangerous diseases such as diabetes.
 - E. Coffee had come out of Africa even before the westerners found out about it.
16. More than two billion cups of coffee are drunk every day and for many, working life would feel impossible without it. As traditionally tea-drinking countries like China are seduced by coffee’s charms, it may soon become the world’s favourite drink. What is driving this insatiable thirst,

and how has the beverage come to conquer the world? Coffee’s story starts in the lush highlands of Ethiopia, the natural homeland of the delicate Coffee arabica plant. Although they are called “coffee beans”, the plant is not a legume, and the fruits of the coffee tree look more like cherries when they are first picked. The seeds inside are extracted and dried before the process of roasting turns them into the hard, nutty nodules we feed into our grinders.

The Oromo people from Ethiopia are thought to have been the first to have noticed the stimulating effects of these “beans”, and coffee still remains an important element of their traditional cuisine. Exactly how and when it spread beyond Ethiopia is still the subject of many legends, but the available historic records suggest that the Sufis of Yemen were the first truly devoted drinkers outside Africa in the Middle Ages. Its caffeine helped them to continue their practices late into the night, while the roasting of the bean was apparently taken as an analogy for the transcendence of the human soul.

Coffee houses soon spread across the Middle East and the Ottoman Empire, where they caught the attention of Western traders, who took the beguiling drink back to their home countries in the 17th Century. (...). One newspaper advert in 1657 described the drink as “having many excellent virtues, closes the orifice of the stomach, fortifies the heart within, helps digestion, brights up the spirit.”
